The boundary

What it refuses, and what makes each refusal structural

What is measured, and what those numbers mean

What is not built — stated plainly

What EverEcho is

A consented family memory archive. Somebody records their own life story, reviews everything before it is kept, and decides exactly who may see what. Their family can then ask questions and get answers that point back at the recording the answer came from.

Everything in this document follows from one sentence:

THE RULE

Nothing is ever spoken in the person’s voice that the person did not actually say. Not paraphrased. Not “in their style”. Not stitched together from fragments into a sentence they never uttered. Played, or not played.

Most products in this category answer the moment of loss with a simulation: a synthetic voice saying something the person never said. It demonstrates beautifully, and it is a forgery. EverEcho answers it by playing the real recording, or by saying honestly that there is none.

That constraint is not a limitation the product works around. It is the reason most of the code exists, and nearly every capability below is shaped by it.

The three people in the product

WHO	WHAT THE PRODUCT IS FOR THEM
The storyteller	It is their archive. They record, they approve every entry, they decide who sees what, and they can delete all of it. Nothing is kept without a decision from them
The family	They read approved stories, ask questions, get cited answers, hear real recordings, and can ask the storyteller things directly
The buyer	Somebody who paid for the archive as a gift. Notably this buys them <i>no</i> access to the memories, and no ability to consent on the storyteller’s behalf

What runs where

Three programs and a database, all of which run on a laptop with no credentials at all. Every outside service the product could use — speech recognition, language models, email, payments, virus scanning, storage — has a local implementation. They are not stubs that always succeed: the local speech recogniser cannot recognise speech and says so, rather than inventing words, because an invented transcript would become an invented memory.

How a life gets into the archive

Four ways in, and one gate all of them pass through: the storyteller decides, item by item, before anything is kept.

STORYTELLER

Real-time voice conversation

A live spoken conversation with an interviewer that listens, asks a follow-up, and can be interrupted mid-sentence. Speech in, speech out, with a running transcript and the sources appearing beside it as they are used. Typing is offered as a first-class alternative, not a fallback.

The screenshot shows the EverEcho interface for a user named Kamala Deshpande. The interface is divided into a left sidebar, a main content area, and a bottom section.

Part of this conversation did not arrive

Some of what was said may be missing from the transcript below. It is safer to say so than to show a record with a silent hole in it.

Transcript

YOU

We moved to Pune in 1962.

EVERECHO AI

Who else was there at the time? Said directly

Where this comes from

Sources appear here as they are used, before the sentence they support is finished.

Talk out loud. The identity notice is the first thing on the page and never dismissible. The status line carries the state in words so a screen reader announces it. A dropped frame is declared rather than papered over.

The banner says **“This is EverEcho’s AI assistant. It is not the storyteller.”** before a word is spoken. Every spoken clause carries a citation chip, and a clause that fails verification is discarded rather than rewritten — rewriting means guessing what it should have said.

What the conversation suggested, and who decides

A conversation produces suggestions, never entries. Each one is shown with the exact words behind it, and the storyteller approves, edits or discards it one at a time.

Said directly

The courtyard had a neem tree my mother planted the year we arrived in Pune, and the mornings smelled of cardamom from the kitchen window.

What you actually said

The courtyard had a neem tree my mother planted the year we arrived in Pune, and the mornings smelled of cardamom from the kitchen window.

Add this to the archiveKeep, but private to meEdit firstNo, drop this

That was Shanta, who ran the shop below us.

Said directly

That was Shanta, who ran the shop below us.

What was learned. Nothing on this screen is in the archive yet.

Three independent mechanisms hold this: a CHECK constraint in the database, an authorisation rule, and a release-blocking evaluation that counts **memories saved without review** against the database itself. It currently reads zero, and a release is refused if it does not.

EverEcho · What It Can Do

5

Review, correct and approve

The whole archive as a review queue. Drafts are visibly marked as drafts, AI-assisted text is marked as AI-assisted, and a correction supersedes the machine transcript without erasing it.

Review stories. Provenance is on the card, not buried in a detail view: a reader can always tell what the storyteller actually said from what a machine arranged.

EverEcho · What It Can Do

6

Questions from the family, answered privately

A relative asks the storyteller something directly. It arrives in a private inbox. They answer, decline, defer, or answer for one person only — and the answer becomes a citable source in the archive.

Ask the storyteller

A question goes straight to them, privately. What they do with it is theirs to decide.

Kamala Deshpande decides what happens to this

Your question goes only to Kamala Deshpande. Nobody else in the family can see it. They can answer it, keep the answer between the two of you, or leave it — and if they leave it, you will not be told why.

What would you like to ask?

One question at a time works best. Specific questions are easier to answer than large ones — “what did the kitchen smell like” gets further than “tell me about your childhood”.

What did the house in Pune look like?

Send this question0 / 2000

Questions you have asked

Ask the storyteller. Asking the archive and asking the person are different things, and the difference is the product. Two entries in the navigation, deliberately.

Declining tells the asker only that the question is closed. The private note about *why* reaches the storyteller’s screen and no other. A restricted topic is refused at the moment of asking, before it ever reaches the person.

EverEcho · What It Can Do

7

Things you might like to say more about

The archive reads its own approved words for things they mention and never explain — an unnamed “he”, a date given as a feeling, a place called “back there”, a story referred to and not told.

Review stories

Say more

What was learned

Say more

A few places where your own words mention something without explaining it. None of this is missing — it is only somewhere you could say more if you want to.

This is not a checklist

Each of these is somewhere your own words mention something without explaining it. There is no score here, nothing is missing, and an archive with none of these answered is not worse than one with all of them. Say more if you feel like it. Put anything away for good and it will not come back.

You mentioned “somebody”. Who was that?

Because of something you said in [this story](#).

Say moreNot nowNever ask again

You mentioned “he”. Who was that?

Because of something you said in [this story](#).

Say moreNot nowNever ask again

You mentioned “my cousin”. Who was that?

Because of something you said in [this story](#).

Say more. No score, no percentage, no streak, no “your archive is 40% complete”. There is no column in the database that could hold one.

It reports absences of detail in a sentence, never the absence of a subject. **“You have not talked about your father” is a claim about somebody’s life; “you said ‘he told us to leave’ and never said who” is a fact about a sentence.** Only the second exists here. “Never ask again” sits at the same weight as answering, and means never.

What the family gets

Answers that point at their source, refusals when there is nothing, and the real recording where one exists.

FAMILY

A cited answer, with the source one tap away

Ask a question in ordinary language. Every claim in the answer carries a citation, and opening it shows the passage the claim came from — in the recording or document it was taken from.

Ask

Where did the family move to?

AI-assistedWritten about Kamala Deshpande, not as them

We managed, and I would rather the family did not dwell on it.1 source

Said directly

"We managed, and I would rather the family did not dwell on it."

From session-05-money.webm (audio) at 0:40

We moved to Pune in 1962 because my father took a job on the railways.1 source

Said directlyThe recordings disagree about this

Composed by local-deterministic@local-deterministic-v1/compose-2026-01 under consent policy-1/archive-policy-v1.

EverEcho v0.1 — a working name pending trademark clearance. Data region: local.
Legal copy version: legal-copy-2026-01-draft (draft, pending review by qualified counsel).

EverEcho preserves what a living person actually said. It does not recreate anyone's voice, likeness or personality, and it will not answer as them. [How consent works](#) · [Support](#)

Ask a question. The citation is not a footnote. It resolves to the words themselves.

Verification runs **per clause, before synthesis**. A clause that cannot be supported is discarded, never softened. Claim-to-citation correctness is a release-blocking metric and currently reads 100%.

An honest refusal when the archive does not know

Asked something nobody ever recorded, the product says so. It does not estimate, infer from era and place, or produce something plausible.

Ask about Kamala Deshpande

Answers come only from what they actually said, and every part shows you where it came from.

What this can and cannot do

This searches Kamala Deshpande's own recordings and documents and tells you what they said. It will not answer as them, guess what they might have thought, or fill in a gap. When the archive does not support an answer, it says so.

Your question

Ask

What was her favourite food?

I don't have enough evidence in this archive to answer that reliably.

“What was her favourite food?” The archive mentions cooking smells, which is not the same as a stated preference — and the difference is the entire product.

The exact sentence is fixed: *“I don't have enough evidence in this archive to answer that reliably.”* Abstention on no-evidence and sensitive questions is release-blocking at **100%** — not 95%, because one confident fabrication about somebody who died is one too many.

Hearing the actual recording

A question returns the moment in a real recording where they answered it, with ten seconds of lead-in so it is a moment rather than a soundbite, ending where they stopped talking rather than where the answer stopped.

Listen

Their own voice, from their own recordings. Nothing here is generated, and nothing is edited.

What are you here for?

☒ Hear them talk about something
 ☐ Tell them something that has happened

What would you like to hear them talk about?

What would she say to me now?

Find it

This plays what Kamala Deshpande actually recorded. It will not read anything aloud in their voice, and it will not guess what they might have said.

The archive

I can't speak as them, and I won't imagine what they might have said. What I can do is find what they actually said, in their own words and their own voice, and show you where it came from. Ask me what they said about something, and I'll find the recording.

Listen. Shown here refusing "What would she say to me now?" — the phrasing a grieving person actually types. The boundary is stated on the page before anybody asks, so nobody is surprised by it.

The server never touches the audio. It returns a signed link to the original file and a time range, and the browser plays that range. No code in the repository reads audio bytes, so there is nothing that could splice two true moments into a sentence she never said — which is how a real recording becomes a false statement without a single fabricated word.

Telling them something that has happened since

Share your news. The archive does not react to it — it has no standing to. What it does is work out what the news is about and find a moment from their own life on the same subject, in their own recording.

Listen

Their own voice, from their own recordings. Nothing here is generated, and nothing is edited.

What are you here for?

☐ Hear them talk about something

☒ Tell them something that has happened

What would you like to tell Kamala Deshpande?

I got the job, Aai

Tell them

Nothing here answers you back. What it can do is find a moment where Kamala Deshpande talked about the same thing in their own life, and play it.

The archive

They talked about work in their own life. Here is that moment.

“I got the job, Aai.” No congratulation. Instead, her in 1971, telling you her first class had fifty-three children in it and one blackboard.

The mapping is from news to **subjects** — work, marriage, a child, a move — and there is no column that could hold a sentiment, because the archive has no standing to decide whether somebody’s news is happy. When there is nothing it says so, without implying she would not have cared.

A life in order

Approved memories placed in time, including the ones whose dates are approximate and the ones that contradict each other. A contradiction is surfaced for the storyteller to judge, never silently resolved.

Permissions

You decide all of this, and you can change any of it whenever you like.

How much may be done with your stories?

☐ **Keep it safe, and nothing else**
 Recordings and files are stored privately. Nothing is transcribed, read or searched.

☐ **Also write down what I said**
 Recordings are transcribed and documents read, so you can correct them and build story cards.

☐ **Also let people search it**
 People you allow can search the archive and see a timeline of what you told us.

☒ **Also let it answer questions and draft a biography**
 Answers are written in the third person and always show the recording they came from.

What specifically may happen?

Each of these is a separate decision. You can allow answers to be composed while still refusing to have your documents read, for instance.

☒ Write down what I said in recordings

☒ Read the text in documents and letters

☒ Index my stories so they can be searched

☒ Compose answers and biography drafts

☒ Let an outside provider do that processing

Permissions. The prohibited capabilities are shown as permanently off, not as switches somebody could be talked into flipping.

Authorisation is a **pure function**: actor, action, resource, subject in; allow with obligations or deny with a reason code out. The obligations are compiled into the retrieval query, so “what may this person see” is answered by the database rather than by a filter applied afterwards.

What happens after

What the family may hear once they are gone, per subject and per person, decided while they are alive and able to decide it. Refusing is offered at exactly the same weight as permitting.

After. The first question is the one nobody else can answer: when you are gone and somebody asks for something you never mentioned either way, what should happen? The product refuses to choose a default.

Death is established by a named human against documentary evidence, and written into the archive’s own activity log. There is no inactivity timer and no inferred death, because releasing a living person’s archive to their family is not recoverable. After activation nothing edits the directive — not the family, not an administrator: the person it speaks for cannot revise it any more, so nobody else may.

Capsules: a few stories, for a few people

A handful of memories, packaged for named people, optionally not before a date and not after another. Withdrawable at any moment, from the capsule itself rather than a settings page.

Capsules

A few stories, for a few people, for as long as you choose.

A capsule never shares more than your permissions allow

Only people you have already given access to, only stories you have approved, and only for as long as you want. Withdrawing one stops it immediately — the only thing it cannot undo is a copy somebody already downloaded, which is why downloading is off unless you turn it on.

Make a capsule

Your capsules

For Anjali 1788547364396

revoked1 storyfor Anil Deshpande

Who has opened it

Capsules. There is no public capsule and no “anyone with the link” mode. The schema offers no way to ask for one.

A capsule narrows what consent already permits and can never widen it: a story made more private after the capsule was built drops out of it. Refused opens are recorded as well as successful ones, on a separate connection, so a refusal cannot vanish with the transaction it aborted.

EverEcho · What It Can Do

16

Everything that was done, including what was refused

What was learned

Activity

Everything that happened in this archive, including everything that was refused.

Refusals are recorded as well as successes. Being able to see that someone was turned away is half of trusting that the permissions work.

WHEN	WHO	WHAT	OUTCOME
9/5/2026, 11:20:27 PM	Kamala Deshpande	realtime.interview.start	allowed
9/5/2026, 11:19:45 PM	Anjali Deshpande	voice.listen	allowed

9/5/2026, 11:19:24 PM	Kamala Deshpande	realtime.interview.start	allowed
9/4/2026, 9:47:02 PM	Anjali Deshpande	voice.listen	allowed
9/4/2026, 9:47:01 PM	Anjali Deshpande	voice.listen	allowed
9/4/2026, 9:46:59 PM	Anjali Deshpande	voice.listen	allowed
9/4/2026, 9:46:57 PM	Anjali Deshpande	voice.listen	allowed

Activity. Most audit logs record successes. The interesting entries are the refusals, and they are here.

Support access appears in this log too. The point is that the storyteller can see that somebody looked at their archive, and what they were able to see — which is operational metadata only, never content.

Deletion, described honestly

Delete the whole archive, or parts of it. The screen states what deletion reaches and what it cannot.

What was learned

Delete this archive

This cannot be undone

Deleting removes the stories, the search indexes, the stored files, the transcripts and every answer that was ever generated. It cannot be recovered afterwards, by you or by us.

One thing is kept on purpose: a record that the deletion happened, with no contents. Proving that we deleted something requires that the record of it survives.

Before you do

Consider exporting a copy first. It takes a moment and gives you everything in files that open without us — you can delete the archive and still keep the stories.

To confirm, type the archive's name exactly: **Kamala's stories**

Delete this archive permanently

Delete. Including the part most products leave out: a copy somebody already downloaded is gone from here and not from them.

What it refuses, and why it cannot be persuaded

A capability list is only half a product. This is the other half, and in this category it is the more important one.

The refusals, and the mechanism behind each

None of these is enforced by a policy document or a system prompt. Each one has a mechanism, and the mechanism is the point — a rule with only a comment behind it is a wish.

REFUSED	WHAT MAKES IT STRUCTURAL
Cloning or synthesising the storyteller's voice	No column can hold a voiceprint. The synthesis voice comes from a table fixed in code. <code>FEATURE_PERFORM_MODE</code> fails configuration validation in <i>every</i> environment, not only production
Face cloning, avatars, lip-synchronised video	No such code path and no storage for one
Speaking as the person, in the first person	Detected before retrieval, so a persona request never causes their memories to be loaded at all; and again after composition, where a first-person sentence throws rather than being spoken
Posthumous conversational simulation	The same two gates, plus a release-blocking evaluation asserting the refusal <i>in the exact words</i>
Any sentence attributed to them that they did not say	Per-clause verification before synthesis. A failing clause is discarded, never rewritten
Joining two real moments into one	The clip selector returns one moment or none — not a list. A function that cannot return two things cannot later be made to join them
Automatic death or incapacity transitions	A CHECK constraint forbids automatic execution; there is no inactivity column because there is no timer
Training a provider on private family data	<code>mip_opt_out=true</code> is hard-coded with no setting able to change it, and the provider factory refuses to start with a provider declaring otherwise
Cross-archive learning or retrieval	Row-level security forced on 56 tables and scoped per transaction. A query written outside the archive scope returns nothing
Memory text in logs, analytics or traces	Reason codes only. The analytics schema admits numbers, booleans and an enum, so a string cannot be passed by accident
Grief-timed marketing, streaks, return-nudges	No scheduled notification path to a bereaved person exists
Profiles for minors	Adulthood is required at archive creation

THE ONE PEOPLE ASK FOR MOST

“Can I just talk to her?” is the most natural question anybody types into this product, and it is refused. The refusal is treated as the most important copy in the product: it lives in one place, every path uses the same text, and a release-blocking evaluation asserts the exact wording. A refusal that still refuses but has been quietly reworded into policy language is a regression no behavioural test would catch.

It also does not end on a no. The framing is stripped from the request and the archive goes and finds what they actually said about the subject underneath it — so the answer arrives with something in its hands.

What is measured

Every figure below was produced by running the project, not estimated.

567	177	50/50	0
UNIT & INTEGRATION TESTS	BROWSER TESTS, 2 VIEWPORTS	AI EVALUATION CASES	ACCESSIBILITY VIOLATIONS

RELEASE-BLOCKING METRIC	TARGET	ACTUAL
Claim-to-citation correctness	≥ 95%	100%
Unsupported material claims	≤ 1%	0.00%
Abstention on no-evidence and sensitive questions	100%	100%
Permission leaks	0	0
Spoken clause citations	100%	100%
Memories saved without review	0	0
Persona refusals, in the exact words	100%	100%

A release is refused if any of these is missed. Spoken clauses are held to 100% rather than 95% because a reader can check a citation and a listener cannot: they hear a sentence and a chip they are not looking at.

Also measured: 115 API routes documented from the same schemas that validate at runtime, so the documentation cannot drift from the behaviour; 17 database migrations; 56 tables with row-level security forced; WCAG 2.2 AA scanned on every screen at two viewport sizes with zero violations.

What is not built

Stated as plainly as the capabilities, because a document that lists only what works is marketing.

NOT BUILT	STATE
Messages recorded to open later	Designed, not implemented. Sealed so the company cannot open one early
Grief-literate pacing	Designed, not implemented. Crisis resources, pause offers, and the rule that no path may analyse a bereaved person's emotional state
The export that outlives the company	Designed, not implemented. A signed archive that opens without EverEcho, with an offline verifier
Hindi and Hinglish	Planned. The original always preserved, any translation labelled as a derived artefact citing it
Three hosted provider adapters	Written, and never run against their real providers . Each one says so in its own file header
Two coverage-radar kinds	Declared in the schema with no detector behind either

AND THE THING NO AMOUNT OF BUILDING FIXES

No real family has ever used this, and nobody bereaved has ever seen it. Every design decision in the remembrance work is a claim about how a grieving person will experience something, and not one of them has been tested with a grieving person. Whether hearing the real voice comforts or wounds; whether the refusal reads as care or as rejection at the moment somebody types *can I just talk to her* — automated tests can prove the product does what it says, and they cannot prove it should.

Traction is **zero**: no customers, no deposits, no design partners, no revenue. The archive in every screenshot in this document is synthetic, and is excluded from any metric that could be mistaken for traction.

Screenshots taken from a live instance running on the seeded demonstration archive, at commit `e82579c`. Everyone and everything in that archive is invented.
